

Linux + Git Cheat Sheet

Quick reference guide for essential terminal commands and Git workflows

FILE BASICS

<code>mkdir foldername</code>	# make a folder
<code>cd foldername</code>	# move into it
<code>cd</code>	# jump home from anywhere
<code>cd ..</code>	# go up one folder
<code>touch file.txt</code>	# create empty file
<code>echo "text" > file.txt</code>	# write text into file
<code>cat file.txt</code>	# view file contents
<code>cp file.txt copy.txt</code>	# copy a file
<code>mv old.txt new.txt</code>	# rename/move a file
<code>rm -i file.txt</code>	# delete a file (asks to confirm)
<code>ls</code>	# list what's in the folder

GIT - GETTING SET UP

<code>git init</code>	# turn folder into a git repo
<code>git add .</code>	# stage all changed files
<code>git commit -m "message"</code>	# save a snapshot
<code>git remote add origin <URL></code>	# connect to GitHub
<code>git push -u origin master</code>	# send local code to GitHub (first time)
<code>git push</code>	# send updates (after first time)

GIT - GETTING UPDATES

<code>git pull origin master --no-rebase</code>	# bring GitHub's changes down + merge
---	---------------------------------------

MERGE CONFLICTS

1. `cat README.md` (or `nano README.md`) to see the conflict
2. Look for `<<<<<<< HEAD / ===== / >>>>>>>`
3. Delete markers + version you don't want
4. Save (`Ctrl+O` , `Enter`) and exit (`Ctrl+X`) in nano
5. `git add . / git commit -m "resolved conflict" / git push`

AUTH (ONCE PER MACHINE)

```
gh auth login
```

log in via browser, no password typing

REMINDERS

- **push** = local to GitHub. **clone/pull** = GitHub to local
- New terminal tab = back at home, `cd` first
- **nano**: `Ctrl+O` saves, `Ctrl+X` exits
